DNA encoding porcine complement inhibitor - useful in porcine organ transplant to humans claim 5; page 12-14; 20pp; Japanese.

This protein is a porcine complement inhibitor encoded by pMCPCDNA (T61098). The DNA is useful for large scale production of recombinant porcine complement inhibitor, which is useful for porcine organ transplantation into humans. The DNA clone pMCPCDNA is also useful in the analysis of the promoter region of porcine complement inhibitor. W12414;

Taltering melanin prodn., for treating e.g. melasma photo-ageing altering melanin prodn., for treating e.g. melasma photo-ageing spots, solar keratosis or vitilish.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signaling protein (ASP) which have and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and fragmentary conditions in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitilingo, leucoderma, some

                                                                                                                                     DNA corresp. to (part of) foot and mouth disease virus RNA - useful in prepn. of vaccines for producing antibodies against the virus Example; Fig 6; 57pp; English.

The inventors claim a DNA molecule comprising a nucleotide sequence corresp. to a portion of foot-and-mouth disease virus RNA (FMDV). The DNA molecule is esp. for a precursor of FMDV capsid protein. It esp. codes for FMDV protein p88 and VPI-VP4. It may code for why VP2, VP3 and VPI contiguously. The inventors also claim a vaccine for stiumlating prodn. of antibodies against FMDV in a mammal which comprises at least one of the above recombinant proteins produced by a host cell transformed with the DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human mature unidate diphosphate galactose-4-epimerase (UDP-G4E) (W01619) catalyses a reversible reaction between UDP-glucose and UDP-galactose that allows galactose residues to enter into the main pathways of glucose metabolism. A deficiency of the enzyme results in galactosaemia. The amino acid sequence of UDP-G4E was deduced from a cDNA clone (T58301) derived from a human endometrial tumour library. Recombinant UDP-G4E polypeptides can be produced in transformed host (e.g. E. coli, COS, Sf9 insect) cells or expressed in vivo for use in the treatment of UDP-G4E deficiency, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

particularly plants for the control of nematodes claim 4; Page 35-39; 44pp; English.

This sequence represents the protein encoded by a polynucleotide of the invention. The polynucleotide of the invention is a sequence from a Bacillus thuringiensis (Bt) isolate selected from PS80JJ1, PS158D5, PS167P, PS167E, PS177F1, PS177G, PS204G4 and PS204G6, that encodes a toxin active against nematodes This sequence represents the 167P protein, and is a delta-endotoxin protein. The polynucleotides and toxins can be used for the control of nematode pests such as Panagrellus
                                                                                                                                                                                                                                                                                                                                                                                                                                     New agouti signal protein peptide(s) and nucleic acids - used for altering melanin prodn., for treating e.g. melasma photo-ageing pepts, solar keratosis or vitiligo
Claim 5; Page 8-9; 67pp; English.
The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some forms of albinism and hair greying.
    Agouti signalling protein; ASP; depigmenting activity; cosmetic; hyperplymentary condition; melasma photcageing spots; solar Keratosis; post-inflammatory hyperplymentation; wound healing; eumelanogenesis; vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-Apr-1998 (first entry).

Claim 6; Page 8-9; 67pp; English.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-SEP-1997 (first entry)

Human agouti signalling protein.

Example; Page 17; 28pp; English.

The sequence is that of a polypeptide present in fraction K of the venom of Agelenopsis aperta, it blocks calcium channels in cells of both mammals and invertebrates, partic. those affecting neuronal and muscle cells. It may be used in the treatment of angina, hypertension, cardiomyopathies, supraventricular arrhythmia, coesophogeal achalasia, premature labour, and Raynaud's disease. It may also be of use in the study of cell physiology and in the control of invertebrate pests. It may be produced synthetically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.693; Variance 44.992; scale 0.704

Mean 30.295; Variance 46.908; scale 0.646 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Gene (1992) 122:63-70.
Four genes in Streptomyces aureofaciens containing a domain
characterstic of principal sigma factors.
                                                                                                                                                                                                                                                                                                                                                                                                               Marcos, A.T.; Diez, B.; Gutierrez, S.; Fernandez, F.J.; Velasco, J.; Martin, J.F. submitted to the EMBL Data Library, December 1993 organization and expression of the hrdb-sprC gene cluster o streptomyces griseus encoding a signa factor protein and serine protease. Role on growth and sporulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              *superfamily transcription initiation factor sigma katF;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 29.753; Variance 52.286; scale 0.569

GENE 122:63-70(1992).

-1- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES
ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND
THEN IS RELEASED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EMBL; M90411; G153306; -.

-1- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES
ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND
THEN IS RELEASED.

-!- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES
ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND
THEN IS RELEASED.

ALIGNMENTS

Refinoid X receptor (RXR) interacting protein (RIP) - useful to modulate or mediate RXR function, anti-RIP antibodies can be used to determine RIP subcellular distribution patterns
Claim 2, Page 48-50; 90pp; English.

Mouse retinoid X receptor (RXR) interacting protein RIP110 (R99737)
is a candidate transcriptional co-activator. It was identified using an in vivo interaction trap system for the isolation of proteins that physically interact with RXRs, esp. with the ligand binding domain of human RXR alpha. Recombinant RIP110 can be obtd. using a cDNA clone (T31930) obtd. from a mouse liver library. RIPS (see also R99735-36 and R99738-39) can be used to modulate or mediate RXR function, and may be used therapeutically or to raise antibodies. 27-5EP-1996 (first entry)

                                                                                                                                                                                        Claim 15; Page 42-50; 78pp; English.

The sequences given in W21731-32 represent fusion proteins which contain NuMA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NuMA interecting proteins (NIP's) (see also W21729-30). Compounds which interfere with the interaction of NuMA (w21729-30). Compounds which interfere with the interaction of NuMA with the interaction interaction with the interaction interaction with the interaction with the interaction with the interaction of NuMA or NIP which may be markers for aberrant (including malignant) call growth (which can also be detected by nucleic acid sequencing). Also where manignancy is related to defects in NuMA or NIP, it can be treated by administration of the appropriate functional protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 14; Page 28-36; 78pp; English.

The sequences given in W21731-32 represent fusion proteins which contain NuMA (nuclear mitroit apparatus). The fusion proteins were used in the identification of NuMA interecting proteins (NIP's) (see also W21729-30). Compounds which interfere with the interaction of NuMA with a known NIP are used to modulate cell division and/or proliferation. As trained conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for diagnostic or therapeutic use, e.g. to detect defective NuMA or NIP which may be markers for aberrant (including malignant) cell growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W21731;

Claim 55; Fig 23; 91pp; English.
Solyapetide sequences (W19629-30 and W00918) can be deduced from
3 Polyapetide sequences (W19629-30 and W00918) can be deduced from
5 Streptomyces venezuelae. The sequence data indicate that the PKS
5 Gene cluster encodes a polyene of 12 carbons. The vep gene cluster
5 Gene cluster encodes a polyene of 12 carbons. The vep gene cluster
6 contains 5 PKS modules, plus a 5' loading module and a 3' end
7 contains 5 PKS modules, plus a 5' loading module and a 3' end
8 contains 5 PKS modules, plus a 5' loading module and a 3' end
8 contains 5 PKS modules, plus a 5' loading module and a 3' end
8 a contains 5 PKS modules, plus a 5' loading module and a 3' end
8 a contains 5 PKS modules, and module a keto-ACP, an
8 a contains 6 PKS module and and a contains
8 contains 6 PKS module cluster and module 7 from the Streptomyces
8 tylp gene cluster has polyhydroxyalkanoate (PHA) monomer synthase
8 a biodegradable polymer.
8 cfor use as a biodegradable polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
The sequence was deduced from clone pHS10-4, isolated from a human lung cDNA library. The protein is part of the alveolar surfactant protein, high mol. wt, hydrophilic 32K gp. The protein differs at 7 positions from a previously published (WO8603408) sequence, and also at several places from two other sequences determined by others. It is believed that the 32K human ASP protein may be encoded by multiple genes. The recombinant protein can be used for the treatment of respiratory disorders.
                                                                               Recombinant alveolar surfactant protein – used for treating respiratory distress syndrome and related diseases e.g. pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Regulatable expression systems - contg. human metallo:thionein-II

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                  Disclosure: pp; English.

The sequence was deduced from clone pHS10-5, isolated from a human lung cDNA library. The protein is part of the alveolar surfactant protein, high mol. wt, hydrophilic 32K sp. The protein differs at position 50 from a previously published (WO8603408) sequence, and differs at several places from two other sequences determined by others. It is believed that the 33K human ASP protein may be encoded by multiple genes. The recombinant protein can be used for the treatment of respiratory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pulmonary surfactant proteins - used for treating Hyaline Membrane
Disease or Respiratory Distress Syndrome.

Patent No. 5292646
GENERAL INFORMATION:
APPLICANT: McCOy, John
APPLICANT: LaVallie, Edward
TITLE OF INVENTION: Peptide and Protein Fusions To
TITLE OF INVENTION: Thioredoxin and Thioredoxin-Like Molecules
NUMBER OF SEQUENCES: 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.693; Variance 44.992; scale 0.704

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

on: Thu Jul 30 09:06:53 1998; MasPar time 3.32 Seconds 152.287 Million cell updates/secular output not generated.

Title: >US-08-938-548A-3
Description: (1-33) from US08938548A.pep
Perfect Score: 2-6
Sequence: 1 QPLPDCCRQKTCSCRLYELLHGAGNHAAGILTL 33

Scoring table: PAM 150 Gap 11 Searched: 124785 seqs, 15338987 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq31-2 1:part1 2:part2 3:part3 4:part4 5:part5 6:part6 7:part7 8:part8 9:part9 10:part10 11:part11 12:part12 13:part13 14:part14 15:part15 16:part16 17:part17 18:part18 19:part19 20:part20 21:part21 22:part22 23:part23 24:part24 25:part25 26:part26 27:part27

Statistics: Mean 22.991; Variance 84.736; scale 0.271

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A deficiency of the enzyme results in galactosaemia. The amino acid sequence of UDP-G4E was deduced from a cDNA clone (158301) derived from a human endometrial tumour library. Recombinant UDP-G4E polypeptides can be produced in transformed host (e.g. E. coli, COS, Sf9 insect) cells or expressed in vivo for use in the treatment of UDP-G4E deficiency, e.g.

                                                                                                                                                                                                DNA correspo. to (part of) foot and mouth disease virus RNA - useful in prepo. of vaccines for producing antibodies against the virus Example; Fig 6: 57pp: English.

The inventors claim a DNA molecule comprising a nucleotide sequence corresp. to all or a portion of foot-and-mouth disease virus RNA (FMMY). The DNA molecule is esp. for a precursor of FMDV engals or protein. It esp. codes for FMDV protein p88 and vPl-vP4. It may code for VP4, VP2 vP3 and vPl contiguously. The inventors also claim a vaccine for stiunlating prodn. of antibodies against FMDV in a mammal which comprises at least one of the above recombinant proteins produced by a host cell transformed with the DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some

Pacillus thuringlensis toxin gene - useful in recombinant hosts, particularly plants for the control of nematodes Claim 4; Page 35-39, 44pp. English.

This sequence represents the protein encoded by a polynucleotide of the Invention. The polynucleotide of the Invention is a sequence from a Bacillus thuringlensis (Bt) isolate selected from PS80JJ1, PS158D5, PS167P, PS169B, PS177F1, PS177G, PS20464 and PS204G6, that encodes a toxin active against nematodes. This sequence represents the 167P protein, and is a delta-endotoxin protein. The polynucleotides and toxins can be used for the control of nematode pests such as Panagrellus
   Agouti signalling protein; ASP; depigmenting activity; cosmetic; hyperpigmentary condition; melasma photoageing spots; solar keratosis; post-inflammatory hyperpigmentation; wound healing; eumelanogenesis; vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New agouti signal protein peptide(s) and nucleic acids - used for altering melanin prodn., for treating e.g. melasma photo-ageing spots, solar keratosis or vitiligo claim 5; Page 8-9; 67pp; Engalish.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced emmelanogenesis for treating eg. vitiligo, leucoderma, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOT-APR-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          claim 6; Page 8-9; 67pp; English.
The sequences given in W1010-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human agouti signalling protein.
Agouti signalling protein.
Agouti signalling protein; ASP; depigmenting activity; cosmetic;
hypersignentary condition; melasma photoageing spots; solar keratosis;
post-inflammatory hyperpigmentation; wound healing; eumelanogenesis;
vitiligo; leucoderma; albinism; hair greying.
Example; Page 17; 28pp; English.

The sequence is that of a polypeptide present in fraction K of the venom of Agelenopsis aperta, it blocks calcium channels in cells of both mammals and invertebrates, partic. those affecting neuronal and muscle cells. It may be used in the treatment of angina, hypertension, cardiomyopathies, supraventricular arrhythmia, oesophogeal achalasia, premature labour, and Raynaud's disease. It may also be of use in the study of cell physiology and in the control of invertebrate pests. It may be produced synthetically. Sequence 48 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 39.725; Variance 90.808; scale 0.437 Statistics:

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 41.687; Variance 80.083; scale 0.521
